

Portfolio Site Talking Points

What is your site about and what was the motivation to create it?

I created a portfolio website which displays my skills in design, photography, painting, journaling, and coding. I am interested in many different forms of art, so this site incorporates all of them in one place. I hope to pursue a career in digital media which allows me to combine multiple of my interests, so I wanted to create a website highlighting my diverse skills.

How is your site structured/ what are the different pages

My site contains six pages containing my work. The About Me pages gives basic information about my background. I feel that the About Me is crucial in my site since not everyone viewing my content knows who I am. I also have pages displaying my graphic design, photography, painting, and journaling pieces. Each of those pages features a gallery of my artwork. My last page incorporates my knowledge in Javascript through an interactive tour of Miami.

What Javascript/Jquery libraries are being used here and would you recommend using it for future projects

I used the basic Javascript library as well as an animate library which allowed my to add bouncing effects to my pages. I would recommend using the animate library since there are tons of capabilities for the coder to make their pages more interactive. The hover bounce effect adds a nice touch to my site.

Show site responsiveness

What are your future project plans/next steps to take for your web project if any?

I plan to share my website with people interested in seeing my art. I would also like to put the link of my website on my resume so that future employers can see my work. It would be nice to buy a domain name, so my link is more clean.
